

# Debugging Lab

It's easy to do "Log Driven Development" (dumping console.log's all over your codebase), but it's not all that efficient. With a bit of extra effort, you can upgrade your debugging experience with better tools.

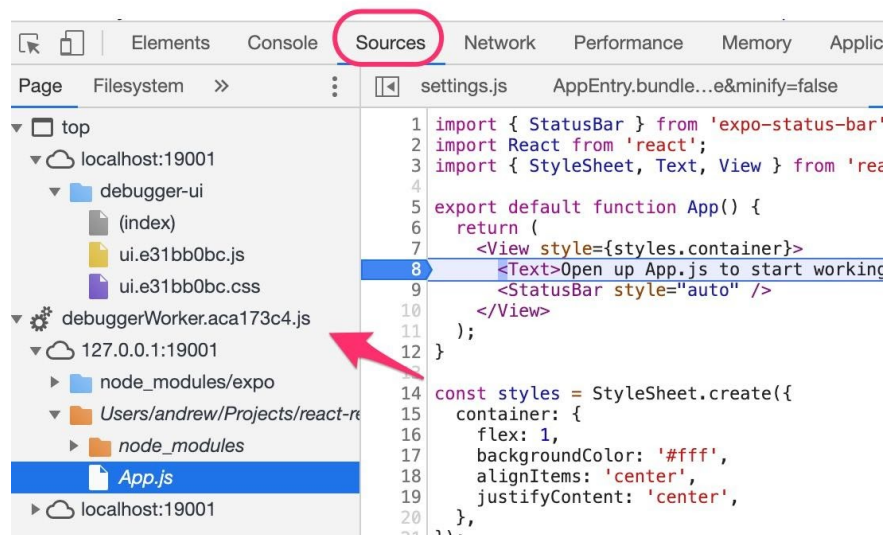

## Remote Debugger

The first one is provided out-of-the-box by expo and React Native. Open up your developer menu in a simulator and choose "Debug Remote JS".

This will open up a browser tab. Open the DevTools in this tab. Now go to App.js and add some console.log statements. Once the App reloads, notice how they appear in the window.

Next, let's try adding some breakpoints. Open up [Sources] > [debuggerWorker.js] > [127.0.0.1] > [your project] > [App.js]

Let's practice writing a couple hooks to simulate loading some data when the component mounts. It should initially say "Data is: loading" and then flip to "Data is: loaded".

```
export default () => {
  const [loading, setLoading] = useState(true)
  useEffect(() => {
    setTimeout(() => {
      setLoading(loading)
    }, 2000)
  })
  return (
    <View style={styles.container}>
      <Text>Data is: {loading ? 'loading' : 'loaded'}</Text>
      <StatusBar style="auto" />
    </View>
  )
}
```

There's a couple trivial bugs in this code, which you should figure out by using breakpoints.

## LogBox

React Native revamped their "LogBox" in 0.62, so let's try them out. Practice adding `console.warn` or `console.error` statements in your app. Notice how it kindly indicates which component the message is coming from. (Believe it or not, that wasn't always a thing. Debugging in React Native used to be... rough.)

## Breakpoints from IDE

Setting breakpoints from DevTools is cute, but let's face it: you're not going to hunt around in your project in DevTools to find the breakpoint. You're mostly working from your editor, and want to set breakpoints there. So, let's get that to work! Here's a couple options depending on your editor of choice:

Webstorm/IntelliJ/etc:

[https://www.jetbrains.com/help/webstorm/react-native.html#ws\\_react\\_native\\_debug\\_expo](https://www.jetbrains.com/help/webstorm/react-native.html#ws_react_native_debug_expo)

Visual Studio Code: <https://github.com/microsoft/vscode-react-native>

Once you've gone through the installation process, try out adding some breakpoints to your app in your code editor and make sure it works!
